H11 and 2F3 cell line

Researchers in Dr. Shoshana Levy's lab have created a pro B cell lines that provides the first B cell lineage tumors in a C57BL mouse strain. The cell lines, known as H11 and 2F3, were made by transducing mouse bone marrow with BCR-ABL retrovirus. The H11 and 2F3 cell lines may be used in immunotherapy and tumor biology research.

Stage of research

The H11 cell line has been used to develop a whole tumor cell vaccine in adoptive cell therapy studies.

Applications

- Tumor biology
- Immunology

Advantages

- First B cell lineage tumors in C57BL strain of mouse
- Grows in tissue culture
- Transplantable in syngeneic mice
- Cell line is MHC class II negative
- Cells can be loaded with reagents and labeled for visualization
- Can isolate ample numbers of these cells to prepare vaccine
