Docket #: S82-008

A Monoclonal Antibody Specific For Mouse Granulocytes - RB6-8C5 and RA3-6B2

Lab Designation: RB6 8C5; A rat-mouse hybridoma cell line producing a monoclonal IgG2b rat AB which recognizes most, if not all, granuloytes and granolucyte precursors in the mouse bone marrow. Major characterization of the RA3-8C5 positive population has been by morphological analysis; however it has also been shown not to overlap in staining distribution with monoclonal antibodies that recognize lymphocytes in the bone marrow.
