Monoclonal Antibodies Dreg-56, Dreg-55, Dreg-200, Against the Human Homing Receptor Lecam-1

Monoclonal Antibodies Dreg-56, Dreg-55, Dreg-200, and Dreg-152 Against the Human Homing Receptor Lecam-1

These would be of interest to researchers interested in understanding the molecular mechanisms of lymphocytes trafficking in the human, to investigators studying cell adhesion phenomena, and to investigations focusing on the molecular mechanisms of lymphoma and leukemia metastasis. They inhibit neutrophil and monocyte entry into sites of acute and chronic inflamed venules in vivo.

The DREG antibodies provide an important probe for myeloid LECAM-1 involved in neutrophil and monocyte extravasation in sites of inflammation. Thus, they may also prove of interest in both experimental settings and in therapeutic studies designed to reduce neutrophil and monocyte-mediated pathologic inflammatory responses.
