

Docket #: S97-184

Monoclonal Antibody to Human CD81, 5A6

5A6 is monoclonal antibody (mAbs) which recognizes human CD81. It was identified by its ability to induce a reversible antiproliferative effect on a human lymphoma B cell line. This mAbs is capable of inducing signal signal transduction and cell adhesion. It is shown to bind to the large extracellular loop (EC2) of human CD81.

Applications

- Flow cytometric studies
- Immunoprecipitations
- Western blots

Advantages

- Most potent inducer of biological responses (i.e. antiproliferative effect, induction of homotypic adhesion, and inhibition of motility in lymphoid cells) compared to currently available CD81 mAbs.
- Excellent Western reagent
