Docket #: S09-379

Hybrid Referenceless and Multibaseline PRF-Shift MR Thermometry

Researchers at Stanford University have developed a more accurate method for estimating temperatures in the heart during thermal therapies such as cardiac ablation. This new method is a hybrid, combining the strengths of referenceless and multi-baseline thermometry to subtract the effects of heart motion and respiration while providing a temperature estimate with a low margin of error.

Applications

- **Medical monitoring** - used to monitor thermal therapies, such as ablation, during cardiac procedures

Advantages

- **Greater accuracy** - estimates temperature with much lower error than techniques based on multi-baseline subtraction or referenceless methods alone
- **Simple** - requires no gating navigator acquisitions or susceptibility modeling
