

**Docket #:** S10-337

# Potent MET receptor agonists and antagonists

## **Stanford Reference: Dockets S10-337 and S10-337B:**

Researchers in the Cochran lab have engineered MET receptor (HGFR) agonists with enhanced stability, ease of production and comparable agonistic activity to wild type HGF. Various groups have demonstrated that MET agonism has therapeutic effects in neurodegenerative diseases such as Alzheimer's and ALS, in stroke, in myocardial infarction, and in pulmonary fibrosis.

## **Ongoing Research**

The inventors are exploring the therapeutic efficacy of this protein in various animal disease models, including models of myocardial infarction.

## **Applications**

- **Therapeutic** for:
  - Neurodegenerative diseases
  - Myocardial infarction
  - Stroke
  - Pulmonary Fibrosis
- **Stem cell and tissue engineering**

## **Advantages**

- **Potent** - agonistic activity similar to full-length HGF
- **Stable**
- **High recombinant yield** in yeast
- Can **incorporate into biomaterials** using a heparin-binding epitope
