

Docket #: S10-392

Sorting Semiconducting Carbon Nanotubes for Electronic Devices

Stanford researchers have developed a simple and effective method to sort semiconducting from metallic single walled carbon nanotubes (SWNT). This scalable technique uses semiconducting polymers to wrap around individual semiconducting SWNTs dispersed in a solution. This solution can be deposited as a transistor film after a centrifugation step.

Schematic of the polymer (blue) wrapped around the semiconducting single walled carbon nanotube (red)

Stage of Research

The inventors fabricated a thin film transistor using the dispersed SWNT semiconductor and demonstrated high semiconducting SWNT purity (>99%), excellent charge-carrier mobility ($-12\text{cm}^2 \text{V}^{-1} \text{s}^{-1}$) and on/off ratio of $> 10^6$ without any post treatment 'burn-off.' This simple and effective method could address key manufacturing challenges to enable widespread adoption of carbon nanotubes in

electronics.

Related Technologies

[Stanford Docket S15-023](#): **Sorting Semiconducting Single-Walled Carbon Nanotubes via Removable and Reusable Polymer**

Stanford researchers successfully purified highly enriched semiconducting single-walled carbon nanotubes (SWNTs) free of any dispersing agent via an easy, fast and scalable method using a recyclable supramolecular polymer.

Applications

- **Carbon nanotube purification** with end user applications in:
 - Solar cells, thin-film transistors, photovoltaic devices, organic light-emitting diodes, biosensors, sensor arrays, and electronic devices on flexible substrates
 - Semiconducting inks

Advantages

- **Simple and Effective** – carbon nanotubes are applied to a device without removal of the dispersant
- **Scalable** for industrial manufacturing of single walled carbon nanotubes
