Machine Learning Model for Dose Volume Histograms (DVHs) and Dose Prediction based on Dosimetric Features

Stanford researchers at the Xing Lab have developed a dosimetric features driven-machine learning model for dose volume histograms (DVHs) and dose prediction for volumetric modulated arc therapy (VMAT) planning. This model is an efficient and robust solution to determine optimized radiation dosage for cancer patients using the patient's dosimetric features as input. As compared to the current complicated geometric/anatomical features-based approaches, this invention will be more simple, accurate, and cost-effective.

A validation study showed the accuracy and effectiveness of this model, indicating its great potential in clinical applications for improved planning and quality control. Additionally, this technique can be applied to other disease sites or radiation therapy modalities, such as head and neck, and lung VMAT, Gamma Knife, stereotactic radiosurgery, and other variants of Intensity-Modulated Radiation Therapy (IMRT).

Figure:

Figure Description: Pipeline of the proposed method.

Stage of Research:

- Pre-clinical
- Demonstrated that this model is capable of efficiently generating best achievable DVHs for VMAT planning using simple planning target volume (PTV)-only plans (or patient's dosimetric feature) as input.

Applications

• Radiation Oncology:

- DVHs/dose prediction for VMAT planning
- The predicted DVHs/dose can be used in knowledge-based and automated planning under the guidance of prior data
- The predicted DVHs/dose can also be used to evaluate treatment plans to ensure a high plan quality

Advantages

- **Robust and efficient solution** for DVHs/dose prediction in treatment planning and quality assurance (QA)
- **Customized** - Dosimetric features of the patient is used as model inputs
- **Automated** - Uses machine learning
- **Time and cost savings**
- **Better patient outcomes**

- **Can be applied to other disease sites or radiation therapy modalities,** such as head and neck, and lung VMAT, Gamma Knife, stereotactic radiosurgery, and other variants of IMRT, including static field and helical IMRT
