

Manufacturing of Composite Grid/Core/Skin Structures

Stephen Tsai and researchers at Stanford University's Structures and Composite Laboratory have designed a composite grid-stiffened skin structure, which is ultra-lightweight, stiff, strong, and easier and less expensive to manufacture. This construction can be made in one piece, with no fasteners, fully interlocked and outside of autoclave, and can replace the conventional three-piece spar/rib/skin structure. One unique feature of the grid is the use of finite length ribs placed in a staggered pattern, so all ribs have same dimensions and height to provide high stiffness and structural integrity.

Instead of using continuous tape mixed with discontinuous inserts, Tsai's new manufacturing method uses discontinuous tape with length twice that between joints. The design lowers cost, has less waste, is ultra-light, tough, and strong. Its open structure ensures that inspection and repair will be easy. The grid/skin structure is suitable for a wide range of lightweight, strong structures including aircraft, space launch vehicle bodies, rockets, automotive panels, and battery cases.

Stage of Development - Proof of Concept Prototype

Tsai's design is ready for application and can be modified for a variety of load cases. Design and experimental iterations are ongoing and include comparison between the new finite length ribs versus continuous tape with discontinuous inserts in flat as well as curved and full barrel panels. For the 2019 Paris Air Show, MTorres manufactured Tsai's designed panel via resin infusion of dry carbon fibers (figure 2). It can also be fabricated using traditional thermoset prepreg. The proposed grid/skin construction is better than traditional isogrid for having only two rib directions instead of three, joint and ribs with the same height, and automated layup.

Applications

- Aircraft fuselage, wings, tails, doors, bulk heads, floor panel, baggage, toilets, galley
- Rockets, cylinders, adapters, fairing, skirts
- Thermoplastics for cars
- Railroad cars for passengers and freight
- Ships
- Sporting goods

Advantages

- Ultra-light weight and stiff- weighs **less than 30 percent of aluminum** with **equal strength and damage tolerance**
- Reduced manufacturing cost and waste
- Automated production feasible - **easier to produce than current manufacturing methods**
- Open structure for easy inspection and repair
- Honeycomb core can be added to ribs to reduce weight and cost, and increase flexural stiffness to weight ratio
