

**Docket #:** S19-367

# **Soft Collapsible Hydraulic Shock Absorber**

Stanford inventors have developed a rechargeable, fluid-based shock absorber material for use in space constrained environments. Foam is the most common form of shock absorption material, but its force exerted is proportional to the degree of displacement. They are also singular in their ideal force profiles making them incapable of adapting to different impact speeds. In applications such as football helmets or automobile safety, this can lead to more damage than the initial impact itself. This design utilizes an incompressible liquid contained within a fabric vessel, which is ejected upon impact as the vessel collapses into an outer elastic refill chamber. As the compression force is removed, the fluid returns to the fabric vessel ready for the next impact. Notably, use of the incompressible fluid allows for the force exerted by the shock absorber to scale with the impact energy making this a versatile mechanism. In the case of personal protective equipment, the force profile can be tuned by adjusting pad size and liquid amount to provide a personalized fit.

## Stage of Research

- Prototype

## Applications

- Helmet shock absorbers
- Automotive safety

## Advantages

- Lightweight & compact
- Ideal for space constrained applications
- Shock absorber exertion force scales with impact energy
- Energy absorption at low force level

## Publications
